lsoId=070325-1; Sequence=External;
-!- TISSUE SPECIFICITY: Repressed exclusively in sperm.
-!- SIMILARITY: Belongs to the glutathione peroxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Q91XE9; Q8K4U8;

                                                                    -!- SUBUNIT: Heterotrimer of an A (A1, A2 or A3), B and C subunit.
-!- SUBCELDULAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Widely expressed.
-!- DOMAIN: The elongin BC complex binding domain is also known as BC-box with the consensus [APST]-L-x(3)-C-x(3)-[AILV].
-!- SIMILARITY: Contains 1 TFS2-N domain.
  Subunit A3 is transcriptionally active but its transcription activity is not enhanced by binding to the dimeric complex of the SIII regulatory subunits B and C (elongin BC complex). SUBUNIT: Heterotrimer of an A (A1, A2 or A3), B and C subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "CDNA cloning and expression of murine macrophage colony-stimulating factor from 1929 cells.";

Note-No experimental confirmation available;
Note-No experimental confirmation available;
Note-No experimental The predominant soluble form is a chondroitin sulfate-confaining proteoglycan.
-!- DISEASE: A defect in CSF1 is the cause of osteopetrosis.
Osteopetrotic mice (op/op) are severely deficient in mature macrophages and osteoclasts, display failed tooth eruption, and have a restricted capacity for bone remodelling.
-!- CAUTION: Ref. 3 sequence was originally thought to originate from rat, but was later shown (Ref. 8 and Ref. 9) to be derived from

-!-FUNCTION: Granulocyte/macrophage colony-stimulating factors are
cytokines that act in hematopoiesis by controlling the production,
differentiation, and function of 2 related white cell populations
of the blood, the granulocytes and the monocytes-macrophage inneage. It plays a
role in immunological defenses, bone metabolism, lipoproteins
                                                                                                                                                                                                                                                                                                                                                                    clearance, fertility and pregnancy.
-!- SUBGNIT: Homodimer or heterodimer; disulfide-linked.
-!- SUBGENIUAR LOCATION: Extracellular. The precursors may exist as integral membrane proteins (By similarity).

--- FUNCTION: Catalyzes the ATP-dependent amination of UTP to CTP with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    either L-glutamine or ammonia as the source of nitrogen (By similarity).

-!-CATALYTIC ACTIVITY: ATP + UTP + NH(3) = ADP + phosphate + CTP.
-!-ENZYME REGULATION: Allosterically activated by GTP, when glutamine is the substrate. Inhibited by CTP (By similarity).
-!-PATHWAY: Pyrimidine biosynthesis; conversion of UMP to CTP; third (last) step.
-!- SUBUNT: Homotetramer (By similarity).
-!- SUBUNT: Homotetramer (By similarity).
-!- SIMILARITY: Belongs to the CTP synthase family.
-!- SIMILARITY: Contains 1 type-1 glutamine amidotransferase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-0CT-1996 (Rel. 34, Created)

Thucosomal recessive segregation of a truncating mutation of a truncating mutation of a truncating mutation.

The action of a truncating mutation of a truncating mutation of anti-Mullerian bergets with its dominant of the register for anti-Mullerian hormone.

I. CIIn. Endocrinol. Metab. 86:4390-4397(2001).

I. CIIn. Endocrinol. Metab. 86:4390-4397(2001).

I. CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

I. CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

I. SUBCELIULAR LOCATION: Type I membrane protein.

I. DISEASE: Defects in AMHR2 are the cause of persistent Mullerian duct syndrome type II (PMDS-2) [MM:261550]; a form of male gestor product syndrome type II (PMDS-2) [MM:261550]; a form of male duct regression in otherwise normal males.

I. SIMILARITY: Belongs to the Ser/Thr family of protein kinases. TGPB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SECUENCE FROM N.A.

L->P: ABOLISHES INTERACTION WITH HSP70
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A->P: ABOLISHES INTERACTION WITH HSP70 AND TNFRSF1A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human and mouse CDNA sequences.";
Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Inhibits the chaperone activity of HSP70/HSC70 by promoting substrate release. Prevents constitutive TNPRSF1A signaling (By similarity).
-!- SUBUNT: Binds to the ATPase domain of HSP70/HSC chaperones. B to the death domain of TNFRSF12 (By similarity). Binds to the approach prevents Dinding of adapter molecules such as TRADD or TRAF2.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.

-i- FUNCTION: ENHANCES THE TRANSLATION OF DOWNSTREAM ORF'S ON POLYCISTRONIC MRNA'S DERIVED FROM CALLIFLOWER MOSAIC VIRUS.
-i- SUBCELLULAR LOCATION: CYtoplasmic inclusion bodies.
-i- MISCELLANEOUS: THE INILUZION BODIES ARE THE SITE OF VIRAL DNA SYNTHESIS, VIRION ASSEMBLY AND ACCUMULATION IN THE INPECTED CE.
-i- SIMILARITY: Belongs to the caulimoviruses viroplasmin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

-!- FUNCTION: ENHANCES THE TRANSLATION OF DOWNSTREAM ORF'S ON POLYCISTRONIC MENA'S DERIVED FROM CAULIFLOWER MOSAIC VIRUS.
-!- SUBCELLULAR LOCATION: Cytoplasmic inclusion bodies.
-!- MISCELLANBOOR: THE INCLUSION BODIES ARE THE SITE OF VIRAL DNA SYNTHESIS, VIRION ASSEMBLY AND ACCUMULATION IN THE INFECTED CEST.
-!- SIMILARITY: Belongs to the caulimoviruses viroplasmin family.

Gene 19:239-249(1982).
--- FUNCTION: ENHANCES THE TRANSLATION OF DOWNSTREAM ORF'S ON POLYCISTRONIC MRNA'S DERLYDE FROM CAULIFLOWER MOSAIC VIRUS.
---- SUBCELLULAR LOCATION: Cytoplasmic inclusion bodies.
---- MISCELLAMBOUS: THE INCLUSION BODIES ARE THE SITE OF VIRLE DNA SYNTHESIS, VIRLON ASSEMBLY AND ACCUMILATION IN THE INFECTED CELL.
---- SIMILARITY: Belongs to the caulimoviruses viroplasmin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CELL.

Transcriptional regulation of the rat mullerian inhibiting substance "Transcriptional regulation of the rat mullerian inhibiting substance "Transcriptional receptor in rodent Leydig cells.";

Proc. Natl. Acad. Sci. U.S.A. 96:13831-13838(1999).

- - FUNCTION: Receptor for anti-Mullerian hormone.

- - CATALYTIC ACTIVITY: ATP + a protein.

- - SUBCELDIAR LOCATION: Type I membrane protein.

- - SUBCELDIAR LOCATION: Type I membrane protein.

- - BUVELOPMENTAL STAGE: Expressed in the mesenchymal cells and 16 and in tubular and follicular structures of the fetal gonads.

- - SIMILARITY: Belongs to the Ser/Thr family of protein kinases. TGFB receptor subfamily.
                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Baarends W.M., Van Helmond N.J.L., Post M., Van der Schoot P.J.C.M., Hoogerbrugge J.W., de Winter J.P., Uilenbroek J.T.J., Karels B., Wilming L.G., Meijers J.H.C., Themmem A.P.N., Grootegoed A.J.; "A novel member of the transmembrane serine/threonine kinase receptor family is specifically expressed in the gonads and in mesenchymal cells adjacent to the mullerian duct.";

Thernev V.T., McMurtrie E.B. Nguyen Q.A., Mishra V.S.,

RA Barbosa M.D.F.S., McIndoe R., Kingsmore S.F.;

RT Indentification of INST2, a brain-specific member of the Chediak-
RT Higashi syndrome gene family.";

Rubmitted (JUN-1998) to the EMBL/Genbank/DDBJ databases.

L. FUNCTION: Binds to type II regulatory submits of protein kinase A and anchors/targets them to the membrane. May anchor the kinase to and anchors/targets them to the membrane. May anchor the kinase to cytoskeletal and/or organalle-associated proteins. May have a role in membrane trafficking.

C. SUBUNIT: Interacts with RII subunit of PKA.

C. SUBCELLULA LOCATION: Cytoplasmic and membrane associated.

Associated with pleomorphic tubulovesicular endomembranes near the trans sides of Golgi stacks and throughout the cell bodies and cell processes. Concentrated at the postsynaptic plasma membrane

IISSUE SPECIFICITY: Predominant in many brain structures. Also expressed at medium levels in spleen, thymus, prostate, testis and covary. Low level expression is seen in heart, kidney, pancreas, skeletal muscle and intestine.
DOMAIN: RII-alpha binding site, predicted to form an amphipathic helix, could participate in protein-protein interactions with a complementary surface on the R-subunit dimer (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE OF 1919-2946 FROM N.A. similarity).
SIMILARITY: Belongs to the neurobeachin family.
SIMILARITY: Contains 1 BEACH downin.
SIMILARITY: Contains 5 WD repeats.
CAUTION: Ref.3 sequence differs from that shown due to a stop codon in position 762.
CAUTION: Ref.5 sequence differs from that shown due to a frameshift in position 2900.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SUBUNIT: Interacts with RII subunit of PKA (By similarity).

Submitted (MAR-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Transcriptional activator. Able to bind to two different type of DNA binding sites. Isoform FOXJ2.L behaves as a more potent transactivator than FOXJ2.S.
-!- SUBCELLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                       Perez-Sanchez C., Gomez-Ferreria M.A., de la Fuente C.A., Granadino B., Velasco G., Esteban A., Rey-Campos J.;
